

PRODUCT – Materials

Quarterly Reported Metrics – Q3 2020 Results

Annually Reported Metrics – 2019 Results

For further details, analysis, and historic data, refer to respective appendices.

VOLATILE ORGANIC COMPOUNDS

Timberland is committed to using adhesives in our stockfit and assembly shoe manufacturing process that cause less harm to the environment. Traditionally, footwear manufacturers use solvent-based chemicals for gluing, cleaning or painting shoe components. Solvent-based adhesives release volatile organic compounds ("VOCs"), which can create human and environmental health hazards. VOCs are chemical compounds that evaporate easily in normal conditions. Measuring grams of VOCs allows Timberland to account for the overall quantity of VOCs used in the production of our footwear. Disclosing chemical consumption in this manner also allows us to target specific, high VOC-content materials for reduction, substitution, or elimination, thereby lowering environmental impact and improving working conditions in factories. To facilitate ongoing reduction efforts and maintain the quality and physical integrity of the shoe, engineering reviews are conducted to promote the use of water-based adhesive in the construction and manufacturing of product.

Q3 2020 Result: Our average use of VOCs per pair was further reduced to 43 grams during Q3, a significant improvement over our Q3 2019 result (52 grams/pair). Styles previously produced at three facilities with historical high-VOC usage were moved to factories that use low-VOC, water-based adhesives, and employ better practices of adhesive application. We remain committed to our goal of averaging 42 grams of VOCs per pair.

Building on the work that Timberland has done to date to use alternatives, execute best practices for application, and minimize air exposure, our parent company's Responsible Sourcing team expanded the scope of its responsible chemistry program (ChemIQ) to include solvent-based adhesives – working with suppliers and adhesive vendors to prioritize substitutions for adhesives with high VOC content.

LEATHER – GOLD/SILVER RATED TANNERIES

Leather processing is a chemical, water, and energy-intensive process. To ensure the leather we purchase is processed using environmental best practices, all our leather suppliers for footwear and apparel undergo an environmental audit under protocols established by the [Leather Working Group \("LWG"\)](#). LWG certification is awarded to tanneries that demonstrate environmental best practices and performance in all areas of leather production, from chemical, water and waste management to energy use and hide traceability. Tannery environmental audit performance is scored on a scale of Audited, Bronze, Silver, or Gold, with separate percentage scores awarded for the degree of hide traceability. In 2008, Timberland made a public commitment to only source leather for our footwear products from tanneries that have an LWG rating of Silver or Gold. In 2015, we expanded this commitment to include the leather we source for our apparel products and accessories.

Q3 2020 Result: During Q3, 96.4% of our overall leather volume used for Timberland® footwear, apparel, accessories and licensed products was produced at tanneries that have a Gold or Silver LWG rating, compared to 95.2% during the same period in 2019. When looking at leather used during Q3 for Timberland® footwear only, 99.5% came from tanneries rated Gold or Silver.

Our licensees' use of non-LWG rated tanneries continues to have an impact on our overall results, however progress is being made. Our licensees understand the importance of increasing the use of more responsible materials in their products and are doing their best to achieve our requirements.

We remain committed to our goal to limit production at non-certified tanneries until they achieve Gold or Silver status.

COTTON

Chemicals used to grow cotton can be detrimental to the health of farmers, and seep into run-off water contaminating lakes, rivers, and waterways. Conventionally grown cotton uses more insecticides and requires significantly more water than organically grown cotton. As such, Timberland has a longstanding goal to increase our use of organic cotton year over year. Organic cotton remains our preference; however, when organic cotton is not feasible, we strive to eliminate our use of conventionally grown cotton. Our new 2020 target is for 100% of the cotton used in our apparel, accessories and licensed goods to be sourced more sustainably than conventional cotton. This includes cotton that is Certified Organic, Recycled or Fairtrade; of US-origin; or sourced as Better Cotton through the [Better Cotton Initiative](#) (“BCI”). Better Cotton can be mixed with other cotton before it reaches the factory, which means that Better Cotton can end up in our products as well as those of our competitors. What a brand can ensure is that the amount of Better Cotton purchased by a factory corresponds to the amount needed for the production of its products. This applies to all brands and textile buyers. By ordering Better Cotton, we support more sustainable cotton production, regardless of where the cotton ultimately ends up (in our own products or in our competitors’). This system, called Mass Balance, enables a faster upscaling of a more sustainable cotton supply than would otherwise have been possible.

Q3 2020 Result: Cotton usage for Timberland® apparel and accessories was 763 metric tons, 92% of which was either organic (56%) or sourced through BCI (36%). Additional data was received for Q1 and Q2, and those results are reflected in the chart above. Our direct-sourced apparel has incorporated responsibly-sourced cotton almost exclusively, and our licensees are making a greater effort to eliminate conventional cotton in their product lines.

FOOTWEAR WITH RECYCLED, ORGANIC OR RENEWABLE MATERIALS

Since 2008, Timberland has implemented product development strategies to increase the use of recycled, organic, and renewable ("ROR") materials in our footwear, and set yearly targets to steadily increase the use of these environmentally-preferred materials. Renewable materials are defined by Timberland as plant-based materials which replace the use of fossil fuels in our products (e.g. castor bean oils used in outsole compounds). Our largest use of ROR in footwear is with recycled polyester ("PET") and recycled rubber.

The chart below reflects the percent of Timberland® footwear that is constructed with at least one major component made from organic, renewable or recycled materials (with a minimum threshold of 10% ROR content within a component). We are pleased with our progress over the years to increase our use of recycled, organic and renewable materials. While some challenges currently exist in utilizing ROR materials over conventional materials, we are confident that by the end of 2020, every Timberland® boot, shoe, and sandal will incorporate ROR materials.

In 2017 we changed our method of reporting our use of ROR materials. From 2011 to 2016 we included all materials, including those used in minor components such as webbings, trims and labels. To drive focus toward using ROR content in more significant components of our footwear, we are no longer including these minor components.

2019 Result: In 2019, 68% of all Timberland® footwear shipped had at least one major component made with 10% or more ROR content, a slight decrease over our 2018 result. Recycled PET continues to be the largest source of ROR materials in our footwear, incorporating over 734,473 pounds – the equivalent of 33.6 million half-liter plastic water bottles. To date, we have incorporated the equivalent of over 380 million plastic bottles into our footwear.

To further advance toward our 2020 goal, we have developed design policies that require ROR content in all new product development, and we are revisiting carry-over styles to engineer in ROR where applicable.

PVC-FREE FOOTWEAR

Polyvinyl chloride (PVC) is a polymer used in a wide variety of applications such as construction, plumbing, and cable insulation, and it is also used in the footwear industry. Unfortunately, the manufacture, use, and disposal of PVC poses environmental and human health hazards. At numerous points in the vinyl lifecycle, hazardous by-products can be formed accidentally and released into the environment. The by-products of the vinyl lifecycle are of concern because many of the components are highly persistent, bioaccumulate, and toxic.¹

¹ Thornton, Joe. *Environmental Impacts of Polyvinyl Chloride (PVC) Building Materials. A Briefing Paper for the U.S. Green Building Council.* Columbia University, *Environmental Impacts of Polyvinyl Chloride (PVC) Building Materials. A Briefing Paper for the U.S. Green Building Council*, www.usgbc.org/drupal/legacy/usgbc/docs/LEED_tsac/PVC/CMPBS%20Original%20Submittal.pdf.

2019 Result: In 2019, 3% of Timberland® footwear shipped contained PVC, which is even with our 2018 result. While not yet at 100% PVC-free, we are proud of the progress we've made over the years to phase out PVC in our footwear. There are stringent performance expectations in certain styles in our Timberland PRO® product line that cannot be met with current PVC-free alternatives. We continue to seek PVC-free material substitutions and to review materials and manufacturing equipment updates to allow for further PVC reduction. Additionally, our parent company VF Corporation's Restricted Substances List policy calls for a complete phase-out of PVC use in all products. For more details see their policy at <http://responsiblesourcing.vfc.com/policies-and-standards/>.

NON-PFC DURABLE WATER REPELLENT

Timberland® products are built to protect our consumers from the elements of nature, and waterproofing is of prime importance to outdoor enthusiasts. Durable Water Repellent (“DWR”) is a coating added to fabrics at the factory to make them water-resistant. PFCs (per-fluorinated compounds) are a class of chemical substances found in many DWRs that are potentially hazardous to humans – at the factory level where the waterproofing is applied, as well as to the end user. Timberland is committed to eliminate all PFCs in our waterproof footwear and apparel. Our end goal is for 100% of our DWRs to be non-PFC. This was a new metric in 2016.

Footwear production result excludes minor trims.

2019 Result: This is our first year reporting non-PFC DWR in accessories fabric, and we are pleased to report that 100% of DWR used is non-PFC. Over the past several years, our apparel team has successfully transitioned the vast majority of their DWR fabrics (99%) to non-PFC chemistry. Our remaining products with PFC-based DWRs have specific performance requirements (e.g. oil repellency for workwear fabrics) that, to-date, can only be achieved with PFC-based chemistry. We are actively researching and engaging chemical suppliers with the goal of identifying non-PFC chemistry innovations that can achieve the required performance attributes for these products.

As footwear is made up of a complex suite of materials and components, we are working to improve our data systems in order to track non-PFC status of all materials/components more accurately and efficiently in the future.

RECYCLED PACKAGING

Since 2007, Timberland has been committed to producing responsible packaging for our footwear. Our boxes are made from 100% recycled materials (at least 80% post-consumer) and from 2007-2011 were printed with soy-based and sesame-based inks. Starting in 2012 we began using water-based inks and have phased out soy and sesame-based inks.

Annually Reported Metrics – 2019 Results

For further details, analysis, and historic data, refer to respective appendices

FACTORY CONDITIONS – COMPLIANCE RATINGS

Timberland’s longstanding commitment to ensuring fair, safe and non-discriminatory workplaces for the 250,000+ workers making Timberland® product around the world dates back to 1994, with the establishment of our Code of Conduct for suppliers. After being acquired by VF Corporation ("VF") in 2011, our Code of Conduct was replaced by VF's Terms of Engagement and Global Compliance Principles. VF’s policy is to monitor every facility that is involved in the manufacture of VF-branded product. This includes all cutting facilities, sewing plants, screen printers, embroiderers, laundries, and packing locations. At the end of each VF audit, the factory receives one of the following ratings:

- **Accepted** – factory has no serious safety, health, or labor issues and is certified to produce VF products for 12 months, at which time a re-audit is necessary to maintain an 'Accepted' rating.
- **Developmental** – factory has some minor safety, health, or labor issues. The factory is authorized to produce for VF while the issues identified are corrected in a timely manner and a follow-up audit is scheduled within 6 – 9 months. If the problems are corrected as required, then the status of the factory will be elevated to 'Accepted.' If not, the factory is downgraded to '**Pending Rejection-180 days**' ("PR-180 days"), at which time they have a final 6 months to satisfactorily resolve the outstanding issues or be downgraded to '**Rejected.**'
- **Rejected** – factory has major safety, health or labor issues. Examples would include excessive working hours, incorrect overtime compensation or locked emergency exits. In this situation, the factory is not authorized to produce VF products. If a factory is Rejected twice consecutively, they are banned from producing for VF for 12 months.

In 2017, VF Compliance began auditing Tier 2 suppliers (textile mills, outsole factories, and tanneries) for life safety issues. Life Safety Audits cover Legal Business Practices, Child Labor, Forced Labor, Health and Safety, Monitoring and Compliance, Worker Residence and Environment. Metrics below include results of both standard compliance audits and life safety audits.

For more detailed information, please see [VF's audit policy](#).

Q3 2020 Result: At the end of Q3, there were 370 factories approved to produce for Timberland. Broken down by business unit, this equates to 54 footwear factories, 120 apparel factories, 99 factories producing licensed goods and accessories, 29 tanneries, and 68 fabric mills and component suppliers. Two hundred three (55%) were rated Accepted, and 167 (45%) were rated Developmental.

VF Compliance audited 90 Timberland factories during Q3. Of the factories audited, 57 (64%) were rated Accepted, 30 (33%) were rated Developmental, and 3 (3%) were rated Pending Rejection. The factories rated Pending Rejection are working on their corrective action plans and will be re-audited within 6 months.

Timberland believes, along with others in our industry, that factory disclosure and collaboration can create common standards and shared solutions – helping to advance global human rights in all our factories. For this reason, we disclose our factories on a quarterly basis. See the most recent factory list [here](#). Although our supply chain sources may change from time to time, our quarterly factory disclosure represents our best attempt to disclose all of Timberland's active factories as of that date.

In addition, Timberland, along with other VF Corporation brands, recently published full supply chain transparency footprint maps on 42 of its most iconic products. The source maps, available on [VF's sustainability website](#), help ensure every step in the production of VF's apparel and footwear meets the corporation's standards of quality, sustainability and social responsibility – from raw material extraction to VF distribution centers. The interactive maps display the number and locations of suppliers in a region and users can zoom in for a close-up look at each supplier, including onsite inspections, verifications and associate interviews.

FACTORY CONDITIONS - SUPPLIER SELECTION

As Timberland's sourcing managers consider new factories, social compliance performance is an important aspect of their vendor selection pre-screening process. Such pre-screening is accomplished by having factories provide evidence of their social compliance performance by way of recent audits by other brands, external monitoring firms, or social certificates, such as WRAP or SA8000. To facilitate discussions internally with our sourcing teams in regard to their commitment to select social/labor compliant factories, we track the number of new factories that receive Rejected or Pending Rejection-180 Days ratings on their initial VF Compliance Audit.

Q3 2020 Result: During Q3, 22 new factories were selected to manufacture for Timberland. One of these factories (5%) was rated Pending Rejection. The factory will be re-audited within 6 months after completing their correction action plan.

HIGG FACILITY ENVIRONMENTAL MODULE

In 2015, VF's Sustainable Operations Team introduced our strategic suppliers to the Higg Facility Environmental Module. The first step is for the factory to complete an online self-assessment, answering questions on seven different components: Environmental Management Systems, Energy Use and Greenhouse Gas Emissions, Water Use, Wastewater/Effluent, Emissions to Air, Waste Management, and Chemical Use and Management. Factories receive a score of 1 to 100. The next step is to have the VF Sustainable Operations Team (or other SAC-approved verifier) verify the factories' scores, by either on-site or off-site evaluation. Scores are aggregated, allowing facilities to benchmark their results against the industry.

2019 Result: At the end of 2019, 100% of Timberland Strategic Supplier factories (both Tier 1 and Tier 2) participated in the Higg Environmental Module. Strategic Suppliers are VF's top volume factories that collectively represent 80% of global production for footwear and apparel. The average score for Timberland Strategic Suppliers that completed the self-assessment is 51, as shown in the chart above.

Once a factory completes the self-assessment, a member of VF's Sustainable Operations Team visits the factory to verify their score. In 2019, 25 factories had their scores verified, and the average score was 50.
